CLAIMS

1

2

1. An electrical machine, such as a three phase current generator and a starter generator, comprising a stator housing; a shaft supported in said stator housing and carrying an impeller; a stator plate pack mounted on said stator housing and surrounding said impeller; means forming a stator and a rotor chamber and a space which is separated from said chambers in a cooling medium tight manner; a cooling medium pump which is driven by a shaft for heating a cooling medium, said cooling medium pump being arranged in said space; a magnetic coupling through which said cooling medium pump is drivable and which transmits a driving moment from said shaft to said cooling medium pump, said magnetic coupling having a driving part and a driven part which are separated from one another by a magnetically inactive and electrically poorly conductive wall.

2. An electrical machine as defined in claim 1, wherein said driven part is formed as a magnetic disk with permanent magnets.

3. An electrical machine as defined in claim 1, wherein said magnetic coupling is formed as an asynchronous drive, one of said parts being formed as an exciter while the other of said parts is formed as an electrically highly conductive disk.

4. An electrical machine as defined in claim 3, wherein said driving part is formed as said exciter and said driven part is formed as said electrically highly conductive disk.

5. An electrical machine as defined in claim 3, wherein said driving part is formed as an electrically highly conductive disk, while said driven part is formed as an exciter.

6. An electrical machine as defined in claim 3, wherein said exciter is formed as an element selected from the group consisting of an electromagnet element and a permanently magnetic element.

2 3

7. An electrical machine as defined in claim 6, wherein said electromagnet has a coil with a current which is controllable or regulatable.

8. An electrical machine as defined in claim 1; and further comprising an outer housing which surrounds said stator housing so that a part of a cooling medium circulation is provided between said stator housing and said outer housing.

9. An electrical machine as defined in claim 8, wherein said outer housing has a cooling medium inlet which is central to said shaft and in which a first bearing point for a pump shaft is located.

10. An electrical machine as defined in claim 9; and further comprising means forming a stator and rotor chamber side wall region which separates said driving part and in which a second bearing point for said pump shaft is located.

3

11. An electrical machine as defined in claim 10, wherein said wall region is a part of a housing bottom which closes said stator and rotor chamber and receives a bearing.

12. An electrical machine as defined in claim 10, wherein said wall region is a part of a wall part which is releasable independently of a bearing of said shaft.
